Re: Analysis of samples identified as "**Georgetown Park Lake**" water samples; samples dated & received – 09/14/20 analysis requested – E. Coli Bacteria.

<u>PARAMETER</u>	<u>RESULT</u>
# 1 sample- E. Coli Bacteria, CFU/100ml	>800.0
#2 sample- E. Coli Bacteria, CFU/100ml	>800.0
#3 sample- E. Coli Bacteria, CFU/100ml	>800.0

Analyses are in accordance with Standard Methods for the Examination of Water and Wastewater, 10th ed.

E.Coli values at the surface were a bit high. The highest observed value of bacteria is >800.0 CFU/100ml. Full body contact recreation (including swimming) counts of E. coli should not exceed 130 (CFU/100mL) as a monthly geometric mean of at least five samples per the State of Michigan standard, or single samples should not exceed 298 (CFU/100) (235 CFU/100mL in a designated bathing beach area) per Federal (EPA) guidelines.

*Current recreational water quality standards do not rely on Total Coliform counts.
